Regional Chesapeake Bay Pollutant Reduction Plan
Amendment No. 2

September 2022
Revised March 25, 2024

WYOMING VALLEY SANITARY AUTHORITY
LUZERNE COUNTY, PENNSYLVANIA

TABLE OF CONTENTS

INTRODUCTION & EXECUTIVE SUMMARY

As authorized by Pennsylvania Act 68 of 2013, the Wyoming Valley Sanitary Authority (WVSA) expanded their purpose and powers to include stormwater management in 2017. This Chesapeake Bay Pollutant Reduction Plan (CBPRP) **Amendment No. 2** represents a regional effort by WVSA to meet a component of the Pennsylvania Department of Environmental Protection (PADEP) Municipal Separate Storm Sewer System (MS4) permitting requirements. More specifically, the permitting requirements covered by this plan include Pollutant Reduction Plans (PRPs) for stormwater discharges to local surface waters that are impaired for nutrients and/or sediment, and Chesapeake Bay Pollutant Reduction Plans (CBPRPs) for stormwater discharges to surface waters located within the Chesapeake Bay watershed. As a regional plan, this CBPRP **Amendment No. 2** addresses both the local impairment PRP and CBPRP requirements.

This document serves to **amend** WVSA's CBPRP dated September 2017, revised August 2019, amended September 2020, and approved by PADEP in December 2019 and May 2021 respectively. Specifically, this CBPRP **Amendment No. 2** addresses changes limited to the proposed structural Best Management Practices (BMPs) Projects to achieve annual pollutant load reduction goals.

In summary, the changes to the proposed list of BMPs and parsing of planning area in this **Amendment No. 2** are as follows:

1. Addition of twelve (12) Stormwater Basin Retrofit projects,
2. Deletion of three (3) Stormwater Basin Retrofit projects,
3. Deletion of eleven (11) segments of Streambank Restoration,
4. Addition of one (1) Vegetated Open Channel projects,
5. Parsing of (2) planning areas located within combined sewer service areas, and
6. Parsing of State-owned property (SCI-Dallas).

The updated **Annual Pollutant Load Reduction Goal is ~~2,373,102~~ 2,343,547** Total Suspended Solids in pounds per year (TSS lbs/ Year), taking into account additional parsed areas from the planning area**.** Inclusion of the proposed BMP changes in this **Amendment No. 2** will have an estimated net increase on the projected Annual Pollutant Load Reduction of TSS (lbs/ Year) from ~~2,647,916~~ lbs to **2,787,057 TSS (lbs /Year).**

This CBPRP **Amendment No. 2** was prepared following the guidance provided in the Pennsylvania Department of Environmental Protection (PADEP) Document 3800-PM-BCW0100k - National Pollutant Discharges Elimination Systems (NPDES) Stormwater Discharges from Small Municipal Separate Storm Sewer Systems Pollutant Reduction Plan (PRP) Instructions, as well as Expert Panel papers on stormwater basin retrofits/restorations.

The general format of this **Amendment No. 2** presents only the sections and appendices from the September 2020 approved CBPRP that are being revised and are material to the proposed BMP Project changes. All revisions are shown in **strikeout (e.g. ~~xxxx~~)** format, and/or **RED** or **GREEN** font as indicated in the respective sections.

SECTION A: PUBLIC PARTICIPATION

A complete copy of the CBPRP, dated September 2017, revised August 2019, Amendment No. 1 dated September 2020, and this **Amendment No. 2 dated March 25, 2024** is available for the public to review at Wyoming Valley Sanitary Authority and on their website at **https://www.wvsa.org/** from March 25, 2024 through April 25, 2024. These documents will be available on the WVSA website for at least 30 days as advertised in the Wilkes-Barre Citizens' Voice. The published public notice contained a brief description of the plan amendment, the dates and locations at which the plan amendment was available for review by the public, and the length of time provided for the receipt of comments. Copies of the public notice as posted on the WVSA website and published in Wilkes-Barre Citizen's Voice is included in Appendix II.

Written comments will be accepted for 30 days following the publication date of the public notice. A **public meeting will be held on April 10, 2024, 5:30PM EST** at Wyoming Valley Sanitary Authority's public meeting room at 1000 Wilkes-Barre Street, Hanover Township, Luzerne County, PA to present the information contained in this Amendment No. 2 to the public. A copy of the CBPRP Amendment No. 2 presentation and any public comment meeting minutes will be included in Appendix II after the public comment period is completed as part of the final submission of this Amendment No. 2 to PADEP.

SECTION E.2: PROPOSED BMPs

This section outlines the BMP implementation strategy developed to achieve the required annual pollutant load reduction goals. The proposed BMPs were determined through a review of previously submitted PRPs from municipalities included in the CBPRP planning area, meetings with the Luzerne Conservation District, and public outreach meetings with elected officials and municipal staff.

Proposed projects have been evaluated in terms of feasibility and anticipated pollutant load reductions in order to meet the goals of this plan. During plan implementation, the proposed BMPs will be designed in accordance with the Pennsylvania Department of Environmental Protection (PADEP) BMP Manual design guidance and all local ordinances. Additional details and calculations for each proposed project developed during the design and implementation project phases will be documented in the Annual MS4 Status Reports. All existing basin retrofit projects will require a hydraulic evaluation to ensure that modifications for stormwater quality improvements will not negatively impact rate mitigation or detrimentally affect neighboring properties.

Multiple BMPs can be retrofitted and/or created to reduce the pollutant load entering the CBPRP Planning Area. Several publicly owned basins already exist within the CBPRP Planning Area; however, they are designed primarily for flood management and rate attenuation. These basins could be retrofitted to increase the water quality management of each basin, which in turn increases the pollutant load reduction. Basin retrofits can be achieved by retrofitting outfall structures, increasing flow paths, creating sediment forebays, introduce meanders to existing low flow channels, amend soils, install water quality vegetation plantings, and develop operations and maintenance programs to ensure the long-term efficacy of the retrofitted BMPs. New basins within the CBPRP area will follow the same pollutant load reduction strategies as retrofit basins; however, they will be constructed in locations where basins do not already exist. The details for these proposed basins can be found in Appendix VI-A.

A summary of the type and scale of BMP projects included in the WVSA strategy is listed in Table 7. The pollutant loading reductions for each proposed BMP were calculated in terms of pounds per year using PADEP's standard BMP Effectiveness Values and the Chesapeake Bay Program Expert Panel Report[7]. Details on individual BMP projects to be implemented in each planning area is provided in Appendix VI.

Edits shown in **GREEN** are additions or revisions to the Plan, and edits shown in **RED** are deletions from the Plan.

Table 7: WVSA BMP Strategy Summary – Amendment No. 2

** All Planning Areas are included in the CBPRP planning area as outlined in Section E.1. of PRP, dated August 2019.

[6] PADEP, "Consideration of Stream Restoration Projects in Pennsylvania for Eligibility as an MS4 Best Management Practice" (June 22, 2017).

[7] PADEP Document 3899-PM-BCW0100M, NPDES Stormwater Discharges from Small MS4s, BMP Effectiveness Values (6/2018), Chesapeake Bay Program Expert Panel, Recommendation of the Expert Panel to Define Removal Rates for Street and Storm Drain Cleaning Practices (5/26/2016), Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects (January 20, 2015).

The BMP strategy outlined in Table 7 represents the best selection of projects after evaluation with respect to various criteria including cost-effectiveness (cost compared to pollutant load reduction - $/pounds TSS removed), feasibility of implementing MS4 BMP design requirements, environmental impact. property ownership, opportunity for public education, and ability to obtain easements and/or partnerships. This BMP strategy will meet the required annual pollutant reductions while also improving the quality of local impaired waterways. The proposed BMPs include large regional BMPs (Basin Retrofits and Stream Restoration Projects) to achieve a major sediment load reduction and smaller Community Based BMPs to target specific impaired waters.

Explanation of the revisions identified in Table 7 are as follows:

- **Toby Creek Impoundment –** Project removed from the Pollutant Reduction Plan (PRP) due to concerns with ability to obtain required agency permitting for proposed impoundment modifications and low cost-effectiveness.

- **Exeter Donna's Way Basin Retrofit** – The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP preparation. Since the last publication of PRP and Amendment No. 1, this project was designed. As part of design, a detailed delineation of the basin drainage area was completed which produced revised final pollutant reduction number.

- **Swoyersville Dana Street Basin Retrofit and Swoyersville Simpson Street Basin Retrofit** – These projects were removed from PRP due to low cost-effectiveness and changes that would be required to the operation of a municipal stormwater pump station.

  During most storm events, stormwater in the drainage areas to these basins flows to a municipal stormwater pump station which pumps to the Swoyersville Creek Street Basin. The Dana Street and Simpson Street basins are only utilized during the infrequent larger storm events, where they function as surcharge basins for the pump station when the rate of stormwater runoff exceeds the pump station capacity. In these larger storm events, the basins serve as holding ponds/overflow areas for the pump station wet well until the pump station can pump this stormwater.

- **Swoyersville Creek Street Basin Retrofit –** The pollutant load reduction number increased due to the elimination of the Dana and Simpson Street basin projects. The drainage areas for those basins are now included in the Creek Street Basin drainage area, pollutant loading number, and pollutant reduction number.

- **Swoyersville Slocum Street Basin Retrofit -** The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP

preparation. Since the last publication of PRP and Amendment No. 1, this project was designed. As part of design, a detailed delineation of the basin drainage area was completed which produced revised final reduction number.

- **Swoyersville Slocum Street Basin Retrofit -** The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP preparation. Since the last publication of PRP and Amendment No. 1, a detailed delineation of the basin drainage area was completed which produced revised final pollutant reduction number.

- **Jenkins Township Main Street & East Saylor Ave New Water Quality Basin -** The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP preparation. Since the last publication of PRP and Amendment No. 1, this project was designed. As part of design, a detailed delineation of the basin drainage area was completed which produced revised final pollutant reduction number.

- **Jenkins Township Demark St Northeast Extension New Water Quality Basin** - The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP preparation. Since the last publication of PRP and Amendment No. 1, a detailed delineation of the basin drainage area was completed which produced revised final pollutant reduction number.

- **Plains Township Wyndtree Oaks Basin Retrofit -** The drainage area, pollutant loading number, and pollutant reduction numbers were estimated as part of planning phase during PRP preparation. Since the last publication of PRP and Amendment No. 1, this project was designed. As part of design, a detailed delineation of the basin drainage area was completed which produced revised final pollutant reduction number.

- **City of Wilkes-Barre – Motor World Basin Retrofit**
  Wilkes-Barre Township – Wyoming Valley Mall Basin Retrofit
  Hanover Township – 300 Lasley Ave Basin Retrofit
  Hanover Township – 325 Lasley Ave Basin Retrofit
  Hanover Township – 600 Lasley Ave Basin Retrofit
  Hanover Township – 1065 Hanover St Basin 1 Retrofit
  Hanover Township – 1065 Hanover St Basin 2 Retrofit
  Sugar Notch Borough – 1072 Hanover St Basin Retrofit
  Sugar Notch Borough – 1110 Hanover St Basin Retrofit
  Hanover Township – 165 New Commerce Blvd Basin Retrofit
  Hanover Township – 335 New Commerce Blvd, Basin 1 Basin Retrofit

  All above basin retrofit projects were added to the PRP due to their high cost-effectiveness and WVSA's successful implementation of partnership agreements with the respective private property owners.

- **Jenkins Township – Main Street/Pittston By-Pass Basin Retrofit & Vegetated Channel** – This project was added to the PRP to address a localized flooding issue from stormwater runoff due to the lack of adequate interior drainage for this area.

- **Unnamed Tributary to Susquehanna River Stream Restoration, Laurel Run Stream Restoration, and the Unnamed Tributary & Mill Creek (Lackawanna River Watershed) Stream Restoration** – These stream restoration projects were removed from the PRP due to site constraints and low cost-effectiveness relative to other projects.

- **Unnamed Tributary from Abrahams Creek Streambank Restoration, Wyoming Borough** – The pollutant reduction number was revised to reflect the actual surveyed length of streambank proposed for restoration as part of the design phase of the project.

- **Abrahams Creek Streambank Restoration, Forty Fort Borough** – The pollutant reduction number was revised to reflect additional length of the streambank restoration added to the project. The project was previously 3 non-contiguous segments of streambank proposed for restoration and is now 1 contiguous larger segment of stream proposed for bank restoration.

- **Newport Creek, Nanticoke City** – Segments of the stream had to be removed from the PRP due to inability to obtain Partnership and Easements from private property owners. The pollutant reduction number was revised to reflect the actual length of streambank proposed for restoration in the final design of the project.

- **Mill Creek (The Bog - Wilkes-Barre & Plains Township)** – One segment of stream on the Wilkes-Barre City side of project was removed due to site constraints; this streambank is part of an existing flood levee system and should not be modified. The other segment of Mill Creek included in this project is located much further downstream and is now included as part of the Gardner & Mill Creek Streambank Restoration project. These revisions changed the length of stream proposed for restoration and the pollutant reduction number for this project.

- Gardner Creek & Mill Creek (Mohegan Sun, Plains Township) – Segments of Gardner Creek were removed from the project due to WVSA's inability to obtain partnership and easement agreements with private property owners. A segment of Gardner Creek located at the confluence of Gardner Creek and Mill Creek was added to the project. The pollutant load reduction number increased due to stream segment revisions as well as utilizing accepted Chesapeake Bay Expert Panel protocols 1 & 3 for credit calculations in addition to the PADEP default rate.

- **Warrior Creek, Hanover Township**- The downstream segments of stream located close to the Susquehanna River were removed from the project due to sensitive archeological issues identified during an archeological site assessment required by the Pennsylvania Historical and Museum Commission (PHMC) review for the project during the preliminary design phase. An upper (i.e. upstream) segment of stream was removed from the project due to inability to obtain partnership and easement with private property owner.

- **Spring Run & Solomon Creek, Hanover Township** - The pollutant load reduction number increased due to utilizing the accepted Chesapeake Bay Expert Panel protocols 1 & 3 for credit calculations in addition to the PADEP default rate.

- **Street Sweeping & Catch Basin Cleaning** – The pollutant load reduction number for this operational best management practice was reduced to be in line with actual annual sediment removed from this activity performed by WVSA since its inception in 2019.

The updated **Annual Pollutant Load Reduction goal is ~~2,367,572~~ 2,343,547 TSS (lbs/year),** taking into account parsing of additional planning areas identified in this **Amendment No. 2**. The pollutant load reductions achieved by the proposed BMPs changes listed above exceed the pollutant load reduction requirements by ~~274,814~~ **443,510 TSS (lbs/yr)**. As allowed during the five (5) year permit cycle, this Plan will be revised based upon actual progress made and new project opportunities.

NOTICE OF PUBLIC PARTICIPATION AND PUBLIC MEETING FOR AMENDED CHESAPEAKE BAY POLLUTANT REDUCTION PLAN

Wyoming Valley Sanitary Authority (WVSA) hereby gives notice of the 30-day public comment period for its amended National Pollutant Discharge Elimination (NPDES) Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) Pollutant Reduction Plan (PRP). Best Management Practices (BMPs) are proposed in the regional Plan to satisfy PRP requirements for the Chesapeake Bay and local stream impairments.

The public is invited to review this document, which can be found on the WVSA website at www.wvsa.org , and provide written comments to:
Samantha Albert, PE
Director of Engineering
1000 Wilkes-Barre Street
Hanover Township, PA 18703
Email: samantha.albert@wvsa.net

The 30-day public comment period begins March 25, 2024 and ends April 25, 2024.

The Plan will be discussed at a public meeting on April 10th, 2024 beginning 5:30 PM at the offices of WVSA at 1000 Wilkes-Barre Street, Hanover Township, PA.

The municipalities participating in the regional Plan include the Cities of Nanticoke, Pittston, and Wilkes-Barre; the Boroughs of Ashley, Courtdale, Duryea, Edwardsville, Exeter, Forty Fort, Harveys Lake, Hughestown, Kingston, Laflin, Larksville, Luzerne, Plymouth, Pringle, Sugar Notch, Swoyersville, West Pittston, West Wyoming, Wyoming, and Yatesville; and the Townships of Hanover, Jackson, Jenkins, Newport, Pittston, Plains, Plymouth, and Wilkes-Barre.

PHILLIP LATINSKI, Secretary

APPENDIX VI-A

PROPOSED BMPS

BASIN RETROFIT PROJECTS
POLLUTANT LOAD REDUCTION CALCULATIONS

Swoyersville – Townsend Avenue Basin Retrofit

Townsend Avenue, Swoyersville Borough (41.180930, -75.521180)

General Information

Ownership: Public
Watershed: Abrahams Creek
Outfall Stream: Abrahams Creek (CWF, MF)
Stream Impairment: Attaining Designated Use

BMP General Information

Drainage area to BMP: ~~363~~ 640.44 acres
Total footprint: 6.1 acres

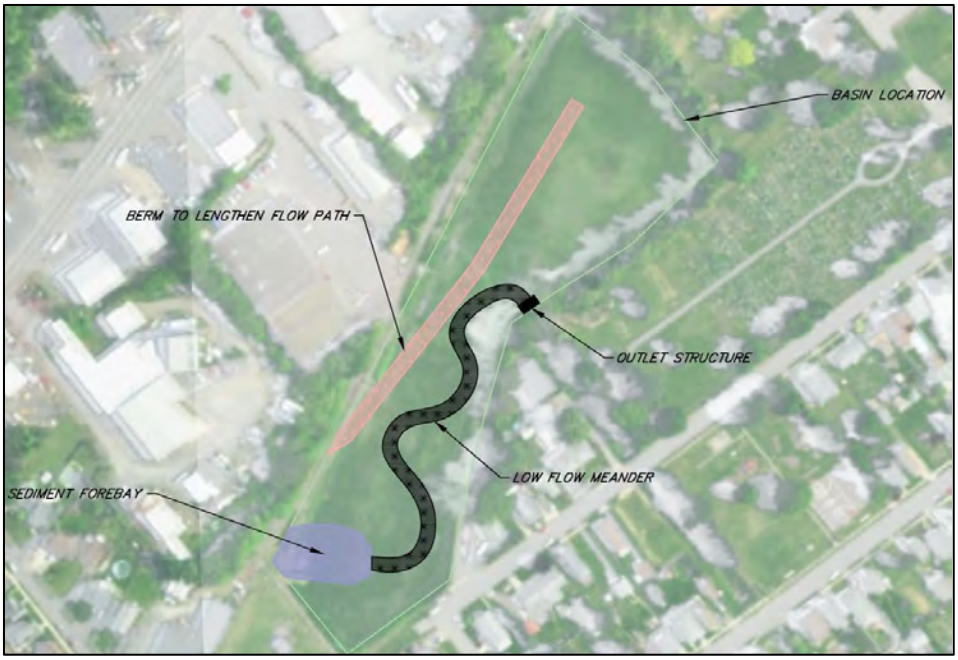
Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	~~139,614~~ 157,275
BMP Efficiency (Expert Panel Report)	~~91%~~ 79%
Basin Retrofit Load Reduction	~~127,049~~ 124,247

Existing Conditions

- Mowed detention basin requiring maintenance to remove accumulated sediment
- Stormwater conveyed to basin via a stormsewer outfall and overland flow
- Area surrounding basin maintained as mowed lawn
- Low flow channel is overgrown and eroded
- Inlet and outfall structures are overgrown and clogged with vegetation and sediment

Proposed Site Upgrades



- Repair eroded low flow channel and introduce a meander
- Retrofit outfall structure
- Expand basin and regrade to include a sediment forebay, berms to increase the flow length of overland flow and a micropool at the outfall structure
- ~~Evaluate existing soils, add amended soils as needed to promote infiltration~~
- Evaluate existing vegetation, remove invasives, and supplement existing vegetation with additional water quality plantings
- Add meadow planting area around perimeter of basin
- Develop an operations and maintenance (O&M) program to ensure continued functionality of basin
- Place educational signage

Swoyersville – Creek Street Basin Retrofit

Creek Street, Swoyersville Borough (41.174240, -75.522797)

General Information

Ownership:	Public
Watershed:	Abrahams Creek
Outfall Stream:	Abrahams Creek (CWF, MF)
Stream Impairment:	Attaining Designated Use

BMP General Information

Drainage area to BMP:	~~349~~ 583.04 acres
Total footprint:	7.7 acres

Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	~~157,919~~ 307,827
BMP Efficiency (Expert Panel Report)	~~91%~~ 79%
Basin Retrofit Load Reduction	~~143,706~~ 243,183

Existing Conditions

- Mowed detention basin requiring maintenance to remove accumulated sediment
- Stormwater conveyed to basin via concrete encased channel and overland flow
- Area of basin maintained as mowed lawn
- Low flow channel is overgrown and eroded
- Inlet and outfall structures are overgrown and clogged with vegetation and sediment

Proposed Site Upgrades

- Repair eroded low flow channel and introduce a meander
- Retrofit outfall structure
- Expand basin and regrade to include a sediment forebay and a micropool at the outfall structure
- ~~Evaluate existing soils, add amended soils as needed to promote infiltration~~
- Evaluate existing vegetation, remove invasives, and supplement existing vegetation with additional water quality plantings
- Add meadow planting area around perimeter of basin
- Develop an operations and maintenance (O&M) program to ensure continued functionality of basin
- Place educational signage

Exeter – Donna's Way Basin Retrofit

Donna's Way, Exeter Borough (41.2834, -75.8857)

General Information

Ownership:	Public
Outfall:	Hicks Creek
Stream Impairment:	Impaired
Designated Use:	CWF, MF

BMP General Information

Drainage area to BMP:	17.9 acres
Total footprint:	0.5 acres

Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	~~12,328~~ 9,363
BMP Efficiency (Expert Panel Report)	~~84%~~ 79%
Basin Retrofit Load Reduction	~~10,356~~ 7,397

Existing Conditions

Post construction stormwater management basin.

No water quality design featured in this basin.

Outlet control structure discharges to Hick's Creek.

Parts of the basin have developed wetland flora.

For Public Review

Proposed Site Upgrades

- Introduce a low flow channel.
- Install baffles or an earthen berm to prevent short circuiting.
- Construct a sediment forebay.
- Construct a micropool near the outlet control structure.
- Retrofit outlet structure.
- ~~Evaluate existing soils, add amended soils as needed to promote infiltration.~~
- Evaluate existing vegetation, remove invasives, and supplement existing vegetation with additional water quality plantings.
- Develop an operations and maintenance (O&M) program to ensure continued functionality of basin.
- Place educational signage.

Swoyersville – Slocum St Basin Retrofit

Slocum St, Swoyersville Borough (41.2834, -75.8857)

General Information

Ownership:	Public
Outfall:	Toby Creek
Stream Impairment:	Attaining
Designated Use:	WWF, MF

BMP General Information

Drainage area to BMP:	223.8 acres
Total footprint:	~~8~~ 6.5 acres

Estimated Pollutant Load Reduction

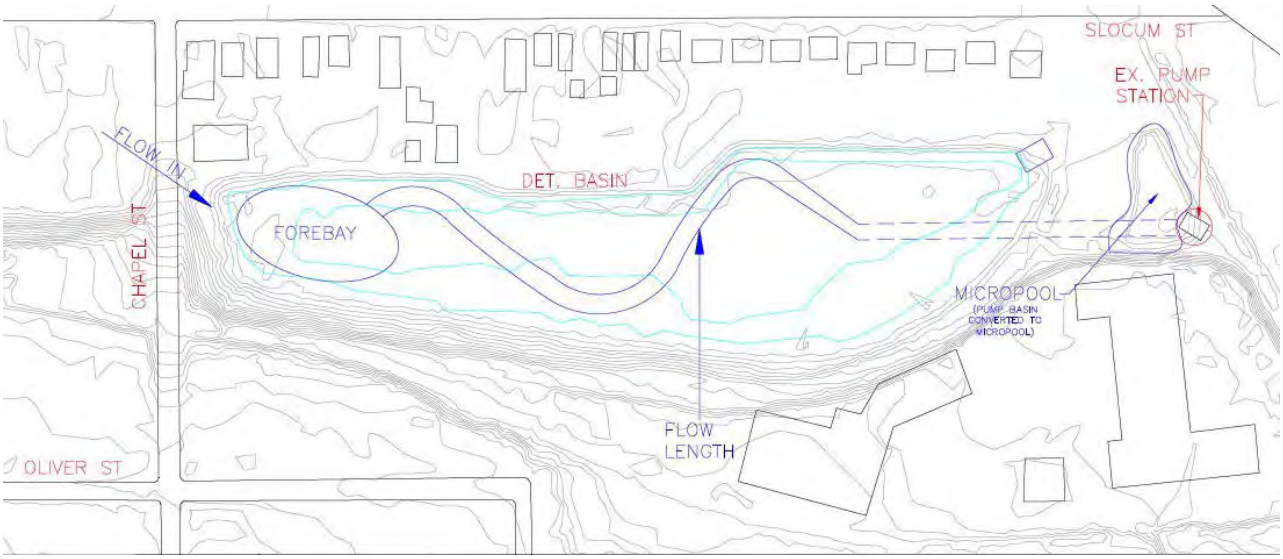
	TSS (lbs/yr)
Total Estimated Load to Basin	120,276
BMP Efficiency (Expert Panel Report)	~~84%~~ 79%
Basin Retrofit Load Reduction	~~101,032~~ 95,018

Existing Conditions

Flood control basin with sediment forebay.
Existing sediment forebay has not been maintained and is filled with sediment.
Low flow channel extends along the east side of the basin.
Groundwater collector swale extends along the west side of the basin.
Primary basin drains beneath an adjacent property and discharges to a ponding area near the existing pump station.
Stormwater conveyed to basin via a culvert at the north end of the basin. A 36" pipe serves to drain the basin into the pump station ponding area.
Parts of the basin and pump station ponding area have developed into wetlands.

Proposed Site Upgrades

- Introduce a meandering low flow channel.
- Retrofit outfall structure.
- Clean out and expand the existing sediment forebay.
- Convert pump basin to a micropool near the existing pump house.
- ~~Evaluate existing soils, add amended soils as needed to promote infiltration~~.
- Evaluate existing vegetation, remove invasives, and supplement existing vegetation with additional water quality plantings.
- Develop an operations and maintenance (O&M) program to ensure continued functionality of basin.
- Place educational signage.



*FLOW LENGTH ≈ 1000 FT

*MICROPOOL V ≈ 10% OF TOTAL BASIN V

*FOREBAY V ≈ 20% OF TOTAL BASIN V FOR 2 YEAR, 24 HOUR STORM FOR SINGLE INLET

*NOTE: VALUES ARE ESTIMATES BASED ON STANDARD ENGINEERING PRACTICES

City of Wilkes-Barre – MotorWorld Basin Retrofit

MotorWorld Complex, City of Wilkes-Barre (41.2561, -75.8399)

General Information

Ownership:	Private
Outfall:	Laurel Run
Stream Impairment:	Impaired
Designated Use:	CWF, MF

BMP General Information

Drainage area to BMP:	35.37 acres
Total footprint of Basin:	0.99 acres

Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	31,084
Ex. NPDES Permit (10% Reduction)	27,976
BMP Efficiency (Expert Panel Report)	62%
Basin Retrofit Load Reduction	17,345

Existing Conditions

Well maintained basin.

No water quality design featured in this basin.

Outlet control structure discharges to Laurel Run.

Some ponding after rain events.

Proposed Site Upgrades

- Create sediment forebay at entrance with stone berm.
- Create low point in stone berm with meandering channel to outlet.
- Modify existing outlet structure with smaller orifice to extend the detention time of the 2-yr recurrence frequency storm, and smaller events.

Wilkes-Barre Township – Wyoming Valley Mall Basin Retrofit

Wyoming Valley Mall, Wilkes-Barre Township (41.2444, -75.8482)

General Information

Ownership:	Public
Outfall:	UNT to Laurel Run
Stream Impairment:	Unimpaired
Designated Use:	CWF, MF

BMP General Information

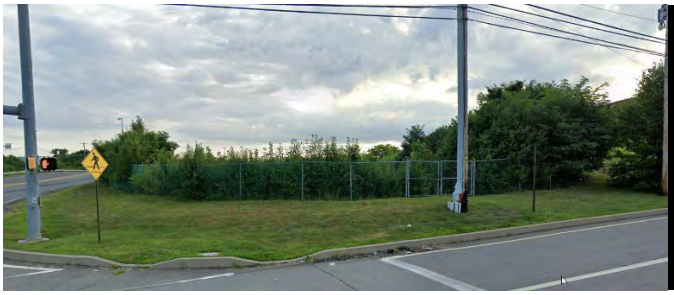
Drainage area to BMP:	68.57 acres
Total footprint:	1.64 acres

Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	102,901
BMP Efficiency (Expert Panel Report)	78%
Basin Retrofit Load Reduction	80,263

Existing Conditions

Excessive vegetation on banks of basin.
Evidence of slight meandering channel.
Deposition of sediments in channel.



Proposed Site Upgrades

- Create sediment forebay at entrance with stone berm.
- Create low point in stone berm with meandering channel.
- Modify existing outlet structure with smaller orifice to extend the detention time of the 2-yr recurrence frequency storm, and smaller events.

Jenkins Township – Main Street Basin Modification

Main Street/Pittston By-Pass, Jenkins Township (41.304872, -75.802864)

General Information

Ownership:	Private
Outfall:	Susquehanna River
Stream Impairment:	Impaired
Designated Use:	WWF, MF

BMP General Information

Drainage area to BMP:	141 acres
Total footprint:	2 acres

Estimated Pollutant Load Reduction

	TSS (lbs/yr)
Total Estimated Load to Basin	84,654
BMP Efficiency (Expert Panel Report)	69%
Basin Retrofit Load Reduction	58,412

Existing Conditions

Well maintained basin

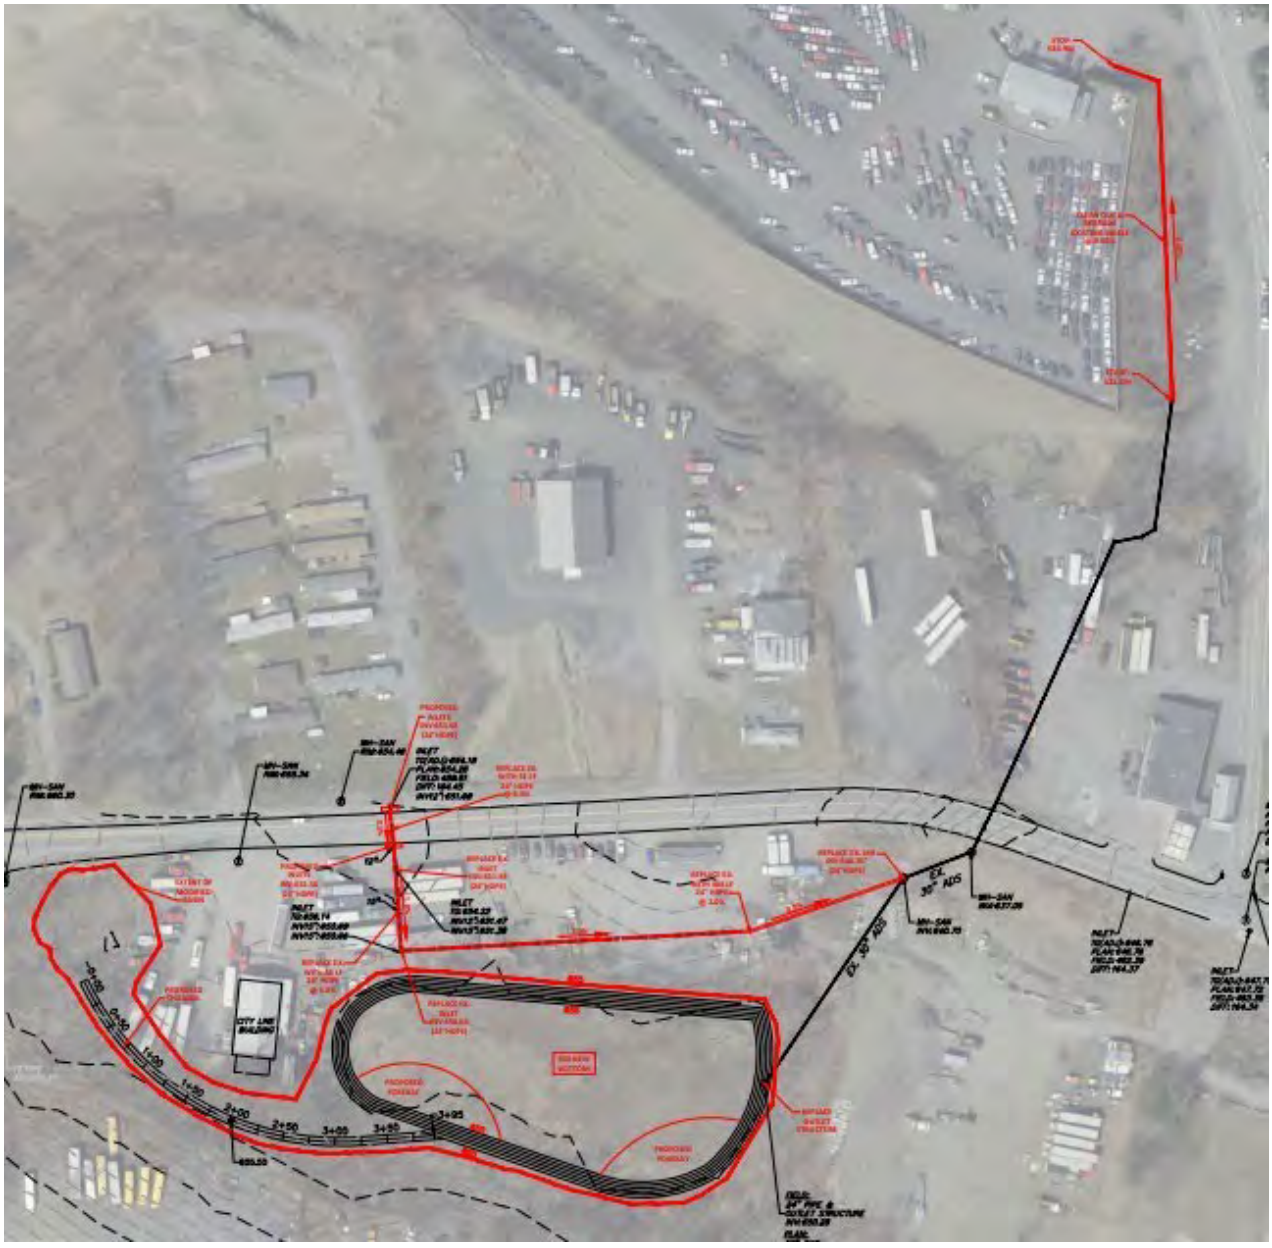
No water quality design featured in this basin.

Ponding on adjacent road.

Some ponding after rain events

Proposed Site Upgrades

- Lower bed of basin to increase holding capacity.
- Create sediment forebays at entrances with stone berm.
- Create vegetated channel downstream of basin to prevent ponding.



Hanover – 165 New Commerce Blvd Basin Retrofit

165 New Commerce Blvd., Hanover Township (41.2100°, -75.9268°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Non Attaining-Impaired
Designated Use:	CWF, MF

BMP General Information

Drainage Area to BMP:	19.13 acres
Total Footprint:	0.339 acre

Estimated Pollutant Load Reduction

Total Estimated Load to Basin: 17,831 TSS (lbs/yr)
*Existing NPDES Permit: 16,048 TSS(lbs/yr)
BMP Efficiency*: 77%
Basin Retrofit Load Reduction: 12,357 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets, storm pipes, and vegetated swales
- Outlet structure designed to manage peak rate runoff via 15” pipe
- Basin runoff is conveyed to headwaters of UNT to Warrior Creek
- Current basin vegetation is mix of native grasses, shrubs, and trees

Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Construct sediment forebays at inlets of swales
- Construct micropools to increase storage capacity
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" PVC underdrain with ½" perforations. Calculations reflect a draw down time of ponding water within 72 hrs.
- Riser structure modifications to include plugging existing, 12" low orifice and V-notch, installing 6" riser extension, installing 2, 6" orifices at varying elevations
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Modeling Results
Existing vs Retrofit Conditions

EXISTING CONDITIONS				***RETROFIT CONDITIONS***

Runoff Volume Retention

- Total runoff volume to the basin is 2.618 ac-ft for the 2-yr, 24-hr storm event
- Runoff from impervious areas to the basin is 2.040 ac-ft for the 2-yr, 24-hr storm event
- Total retention volume of the retrofit basin is 1.492 ac-ft for the 2-yr, 24-hr storm event
- The retrofit basin has been designed to reduce outflows for all storms as mentioned above with plantings and 2-ft of planting media to promote evapotranspiration.
- Regular inspections and maintenance will ensure that functionality of the retrofit basin
- Install a 4" PVC underdrain with ½" perforations. Calculations reflect a draw down time of ponding water to be 46 hrs
- Retrofit basin volume and bottom area will be increased substantially
- The basin retrofit is intended to improve overall water quality. Estimated pollutant reduction is based on the treatment efficiency curve from the "Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects", dated January 20, 2015

Hanover – 300 Lasley Ave Basin Retrofit

300 Lasley Ave., Hanover Township (41.2029°, -75.9297°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Non Attaining-Impaired
Designated Use:	CWF, MF

BMP General Information

Drainage Area to BMP:	23.23 acres
Total Footprint:	0.999 acre

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	20,151 TSS (lbs/yr)
*Existing NPDES Permit:	18,136 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	14,327 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets and a 36” pipe
- Outlet structure designed to manage peak rate runoff via 24” pipe
- Basin runoff is conveyed to headwaters of UNT to Warrior Creek
- Current basin vegetation is mix of native grasses and shrubs

Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Construct sediment forebay at inlets of existing storm pipe
- Construct micropool to increase storage capacity near outlet control structure
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4” underdrain to draw down ponding within 72 hours
- Riser structure modifications to include plugging existing, 12” low orifice and V-notch, installing 6” riser extension, installing 2, 8” orifices at varying elevations
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Modeling Results

Hanover – 325 Lasley Ave Basin Retrofit

325 Lasley Ave., Hanover Township (41.2082°, -75.9262°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Non Attaining-Impaired
Designated Use:	CWF, MF

BMP General Information

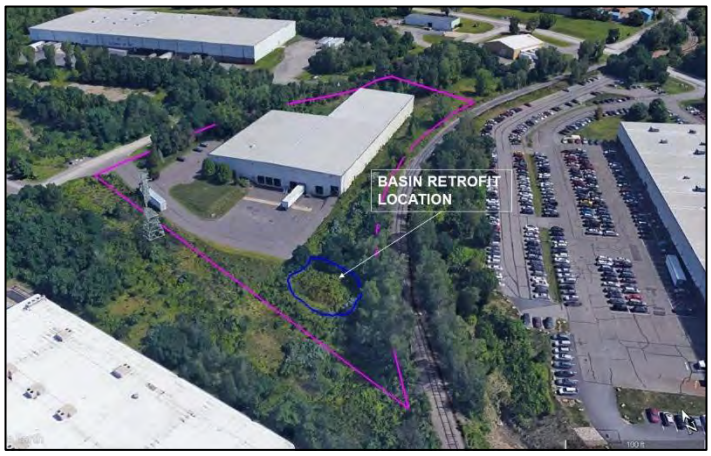
Drainage Area to BMP:	4.82 acres
Total Footprint:	0.245 acre

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	4,248 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	3,356 TSS (lbs/yr)

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets, 15” pipe and vegetated channel
- Outlet structure designed to manage peak rate runoff via 15” pipe
- Basin runoff is conveyed to headwaters of UNT to Warrior Creek
- Current basin vegetation is mix of native grasses and shrubs



Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" underdrain to draw down ponding within 72 hours
- Riser structure modifications to include plugging existing, 6.5" low orifice, and installing 2, 6" and 2, 10" orifices at varying elevations
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

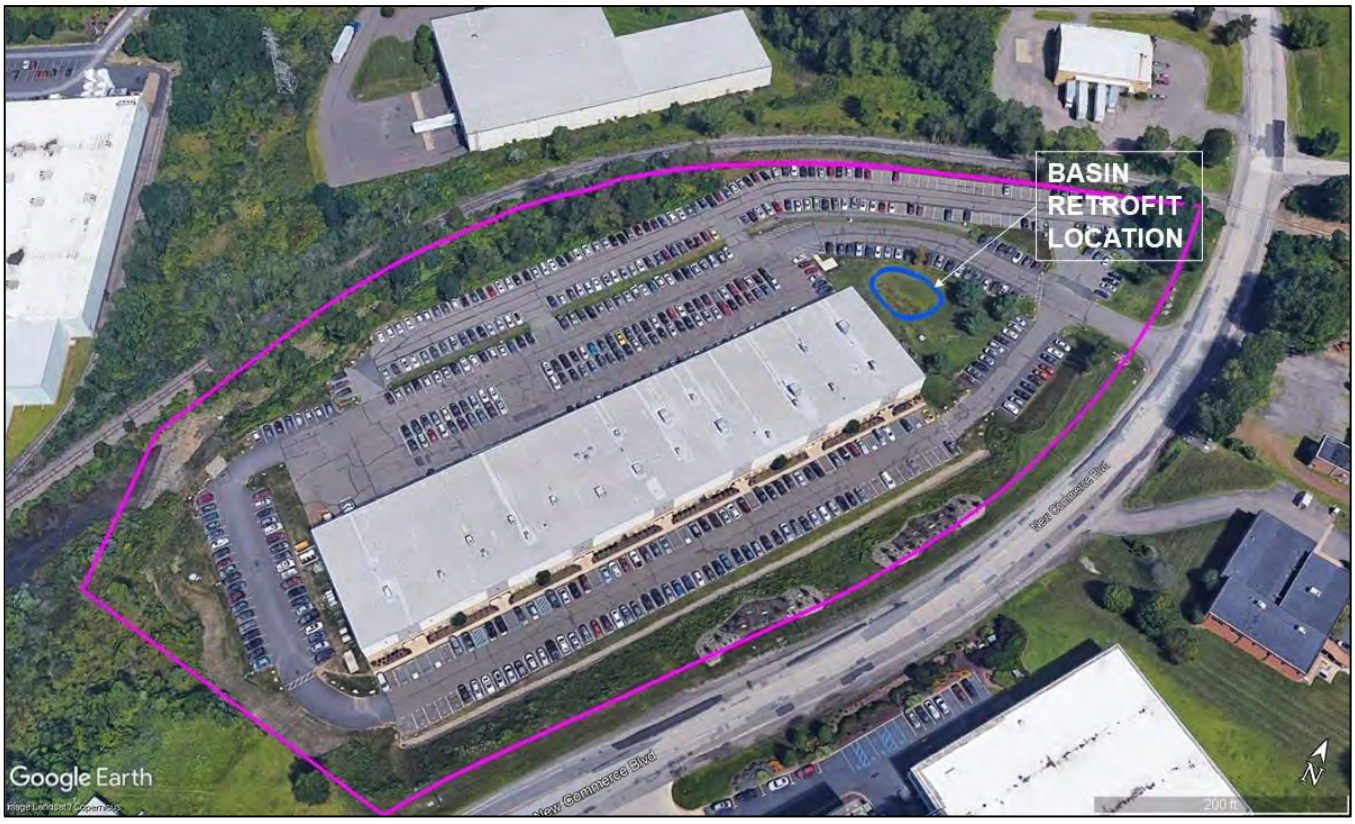
Existing NPDES Permit:	3,810 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	3,010 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to Basin via inlets and various pipes
- Outlet structures designed to manage peak rate runoff via 15” pipe
- Runoff from both basins is conveyed to headwaters of UNT to Warrior Creek
- Current vegetation for the basin is native grasses



Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" underdrain to draw down ponding within 72 hours
- Install an outlet control structure with 2, 4" orifices
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Modeling Results
Existing vs Retrofit Conditions

EXISTING CONDITIONS No Outlet Control Structure					**RETROFIT CONDITIONS** 15" OCS Inlet-TG @ 726.50 2, 4" orifices @ 708.50

100	18.88	14.55	728.16		100	18.88	8.02	727.91

Runoff Volume Retention

- Total runoff volume to the basin is 3.01 ac-ft for the 2-yr, 24-hr storm event
- Runoff from impervious areas to the basin is 2.25 ac-ft for the 2-yr, 24-hr storm event
- Total retention volume of the retrofit basin is 3.96 ac-ft for the 2-yr, 24-hr storm event
- The retrofit basin has been designed to reduce outflows for all storms as mentioned above with plantings and 2-ft of planting media to promote evapotranspiration.
- Regular inspections and maintenance will ensure that functionality of the retrofit basin
- Install a 4" PVC underdrain with ½" perforations. Calculations reflect a draw down time of ponding water to be 26 hrs.
- Retrofit basin volume and bottom area will be increased substantially
- The basin retrofit is intended to improve overall water quality. Estimated pollutant reduction is based on the treatment efficiency curve from the "Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects", dated January 20, 2015

Hanover – 600 Lasley Ave Basin Retrofit

600 Lasley Ave., Hanover Township (41.2029°, -75.9297°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Non Attaining-Impaired
Designated Use:	CWF, MF

BMP General Information

Drainage Area to BMP:	13.75 acres
Total Footprint:	0.454 acre

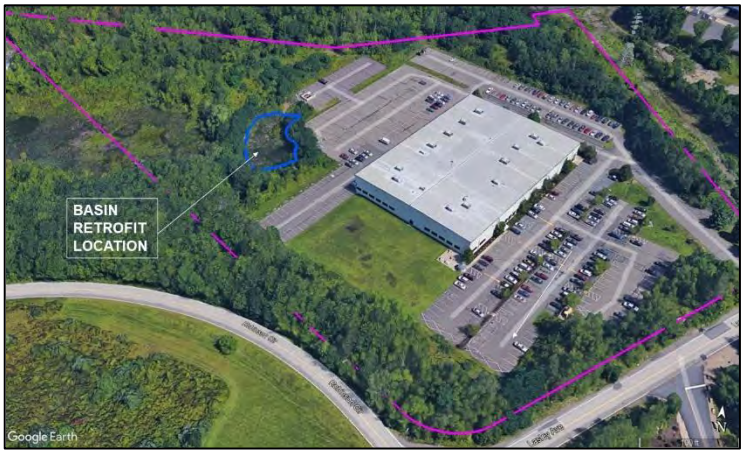
Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	11,475 TSS (lbs/yr)
*Existing NPDES Permit:	10,328 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	8,159 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets storm pipes and vegetated swales
- Outlet structure designed to manage peak rate runoff via 15” pipe
- Basin runoff is conveyed to headwaters of UNT to Warrior Creek
- Current basin vegetation is mix of native grasses and shrubs



Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Construct sediment forebay at inlets of existing storm pipes
- Construct micropool to increase storage capacity near outlet control structure
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" underdrain to draw down ponding within 72 hours
- Riser structure modifications to include plugging existing, 15" low orifice and V-notch, and installing 2, 8" and 2, 6" orifices at varying elevations
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Hanover – 1065 Hanover St Basin Retrofits

1065 Hanover St., Hanover Township (41.2026°, -75.9344°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Non Attaining-Impaired
Designated Use:	CWF, MF

BMP General Information – Basin 1

Drainage Area to BMP:	3.43 acres
Total Footprint:	0.148 acre

BMP General Information – Basin 2

Drainage Area to BMP:	5.29 acres
Total Footprint:	0.229 acre

Estimated Pollutant Load Reduction – Basin 1

Total Estimated Load to Basin 1:	3,527 TSS (lbs/yr)
*Existing NPDES Permit:	3,174 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	2,507 TSS (lbs/yr)

Estimated Pollutant Load Reduction – Basin 2

Total Estimated Load to Basin 1:	7,891 TSS (lbs/yr)
*Existing NPDES Permit:	7,102 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	5,610 TSS (lbs/yr)

* -10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to Basins 1 and 2 via inlets and 18” pipes
- Outlet structures designed to manage peak rate runoff via 15” and 18” pipes
- Runoff from both basins is conveyed to headwaters of UNT to Warrior Creek
- Current vegetation for both basins is mix of native grasses and shrubs

Proposed Retrofits

- Conversion of 2 dry ponds to extended detention basins
- Construct a sediment forebay at inlet for Basin 1
- Modify outlet control structures to increase storage capacity for Basins 1 and 2
- Provide amended soils and compost as needed
- Install supplemental water quality vegetation/plantings
- Develop an operations and maintenance (O&M) program to ensure the continued functionality of Basins 1 and 2
- Install a 4" underdrains to draw down ponding within 72 hours
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Runoff Volume Retention

- Total runoff volume for the 2-yr, 24-hr storm event is 0.513 ac-ft for Basin 1 and 1.046 ac-ft for Basin 2.
- Runoff from impervious areas for the 2-yr, 24-hr storm event is 0.415 ac-ft for Basin 1 and 1.008 ac-ft for Basin 2.
- Total retention volume of the retrofit for Basin 1 is 0.522 ac-ft and the total retention volume for the retrofit for Basin 2 is 1.047 ac-ft.
- The retrofit basins have been designed to reduce outflows for all storms as mentioned above with plantings and 2-ft of planting media to promote evapotranspiration.
- Regular inspections and maintenance will ensure that functionality of both retrofit basins
- Install a 4" PVC underdrain with ½" perforations for each basin. Calculations reflect a draw down time of ponding water to be 24 hrs for Basin 1 and 38 hrs for Basin 2
- Retrofit basin volume and bottom area will be increased substantially for both basins
- The basin retrofits are intended to improve overall water quality. Estimated pollutant reduction is based on the treatment efficiency curve from the "Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects", dated January 20, 2015

Sugar Notch – 1072 Hanover St Basin Retrofit

1072 Hanover St., Sugar Notch Borough (41.2001°, -75.9297°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Attaining/TMDL
Designated Use:	CWF, MF

BMP General Information

Drainage Area to BMP:	11.20 acres
Total Footprint:	0.403 acre

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	13,066 TSS (lbs/yr)
*Existing NPDES Permit:	11,759 TSS (lbs/yr)
BMP Efficiency*:	79%
Basin Retrofit Load Reduction:	9,290 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets and storm pipes
- Outlet structure designed to manage peak rate runoff via 24” pipe
- Basin runoff is conveyed to low area and to headwaters of UNT to Warrior Creek
- Current basin vegetation is native shrubs, trees and grasses

Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Expand basin area, construct vegetated berm, and re-direct main stormwater inlet pipe to prevent short-circuiting
- Re-direct main inlet pipe
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" underdrain to draw down ponding within 72 hours
- Riser structure modifications to include plugging existing, 24" low orifice and installing 2, 8" orifices
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below)
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Sugar Notch – 1110 Hanover St Basin Retrofit

1110 Hanover St., Sugar Notch Borough (41.1997°, -75.9262°)

General Information

Ownership:	Private
Outfall:	UNT to Warrior Creek
Stream Impairment:	Attaining/TMDL
Designated Use:	CWF, MF

BMP General Information

Drainage Area to BMP:	8.02 acres
Total Footprint:	0.476 acre

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	10,065 TSS (lbs/yr)
*Existing NPDES Permit:	9,058 TSS (lbs/yr)
BMP Efficiency:	79%
Basin Retrofit Load Reduction:	7,156 TSS (lbs/yr)

* - 10% reduction applied to basins with NPDES permit

Existing Conditions

- Designed/constructed as a flood control basin for commercial development
- Stormwater conveyed to basin via inlets and 2, 15” pipes and 1, 24” pipe
- Outlet structure designed to manage peak rate runoff via 24” pipe
- Basin runoff is conveyed to low area and wetland, conveyed to headwaters of UNT to Warrior Creek via 36” culvert
- Current basin vegetation is mowed lawn

Proposed Retrofit

- Conversion of a dry pond to an extended detention basin
- Construct vegetated berms to increase flow path and detention time
- Modify outlet control structure to increase storage capacity
- Provide amended soils and compost as needed with supplemental water quality vegetation/plantings
- Install a 4" underdrain to draw down ponding within 72 hours
- Riser structure modifications to include plugging existing, 12" low orifice and installing 2, 6" orifices
- Peak flows were analyzed using Bentley PondPack V8i software to ensure that retrofit conditions do not increase outflows compared to existing conditions (see Table 1 below).
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Modeling Results
Existing vs Retrofit Conditions

100	67.25	30.34	674.66		100	67.25	27.58	674.74

Runoff Volume Retention

- Total runoff volume to the basin is 1.377 ac-ft for the 2-yr, 24-hr storm event
- Runoff from impervious areas to the basin is 1.244 ac-ft for the 2-yr, 24-hr storm event
- Total retention volume of the retrofit basin is 1.695 ac-ft for the 2-yr, 24-hr storm event
- The retrofit basin has been designed to reduce outflows for all storms as mentioned above with plantings and 2-ft of planting media to promote evapotranspiration.
- Regular inspections and maintenance will ensure that functionality of the retrofit basin
- Install a 4" PVC underdrain with ½" perforations. Calculations reflect a draw down time of ponding water to be 43 hrs.
- Retrofit basin volume and bottom area will be increased substantially
- The basin retrofit is intended to improve overall water quality. Estimated pollutant reduction is based on the treatment efficiency curve from the "Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects", dated January 20, 2015

Jenkins – Main St Basin

Main Street, Jenkins Township (41.2966°, -75.8279°)

General Information

Ownership:	Private
Outfall:	Susquehanna River
Stream Impairment:	Attaining/TMDL
Designated Use:	WWF, MF

BMP General Information

Drainage Area to BMP:	160.91 acres
Total Footprint:	4.25 acres

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	115,562 TSS (lbs/yr)
BMP Efficiency:	84%
Basin Retrofit Load Reduction:	97,072 TSS (lbs/yr)

Existing Conditions

- Forested/meadow area location down gradient of suburban/residential areas
- Relatively flat area
- Located close to the Susquehanna River for possible outfall opportunities

* - BMP removal efficiency was determined based on CBP-approved efficiency rates listed in the "Recommendations of the Expert Panel to Define Removal Rates for New State Stormwater Performance Standards"

Proposed Site Upgrades

- Construction of a new stormwater management basin as authorized under DEP Permit No. PAD400140A-1, dated November 11, 2022
    - Management of peak rates (1- through 100-yr storm events)
    - Manage runoff volume through capture and infiltration
    - Addition of amended soils and plantings to promote vegetative growth for water quality
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Peak Flow Routings for Basin 7

BASIN 7 FLOW ROUTING			
Return Event (years)	Inflow (cfs)	Outflow (cfs)	Max Water Surface Elevation (ft)
1	91.76	0.51	576.32
2	131.84	3.07	577.05
5	194.18	8.52	578.08

25	348.08	26.99	580.49
50	438.16	35.82	581.90
100	546.49	42.23	583.66

Runoff Volume Retention

- Total runoff volume to the basin is 18.215 ac-ft for the 2-yr, 24-hr storm event
- Runoff from impervious areas to the basin is 10.836 ac-ft for the 2-yr, 24-hr storm event
- Total retention volume of the basin is 32.190 ac-ft for the 2-yr, 24-hr storm event; total infiltration volume of the basin is 6.566 ac-ft over 35 hrs
- The basin has been designed to reduce outflows for all storms as mentioned above with plantings and 2-ft of planting media to promote evapotranspiration.
- Regular inspections and maintenance will ensure functionality of the basin

- **bold text** notes storage design elevation

* - TSS Pollutant Removal Efficiencies are taken from "Recommendations of the Expert Panel to Define Removal Rates for New State Stormwater Performance Standards" (Revised January 20, 2015)

Jenkins – NE Extension (Demark St) Basins

Demark Street, Jenkins Township (41.2953°, -75.7700°)

General Information

Ownership:	Private
Outfall:	Susquehanna River
Stream Impairment:	Attaining/TMDL
Designated Use:	WWF, MF

BMP General Information

Drainage Area to BMP:	152.73 acres*
Total Footprint:	2.314 acres

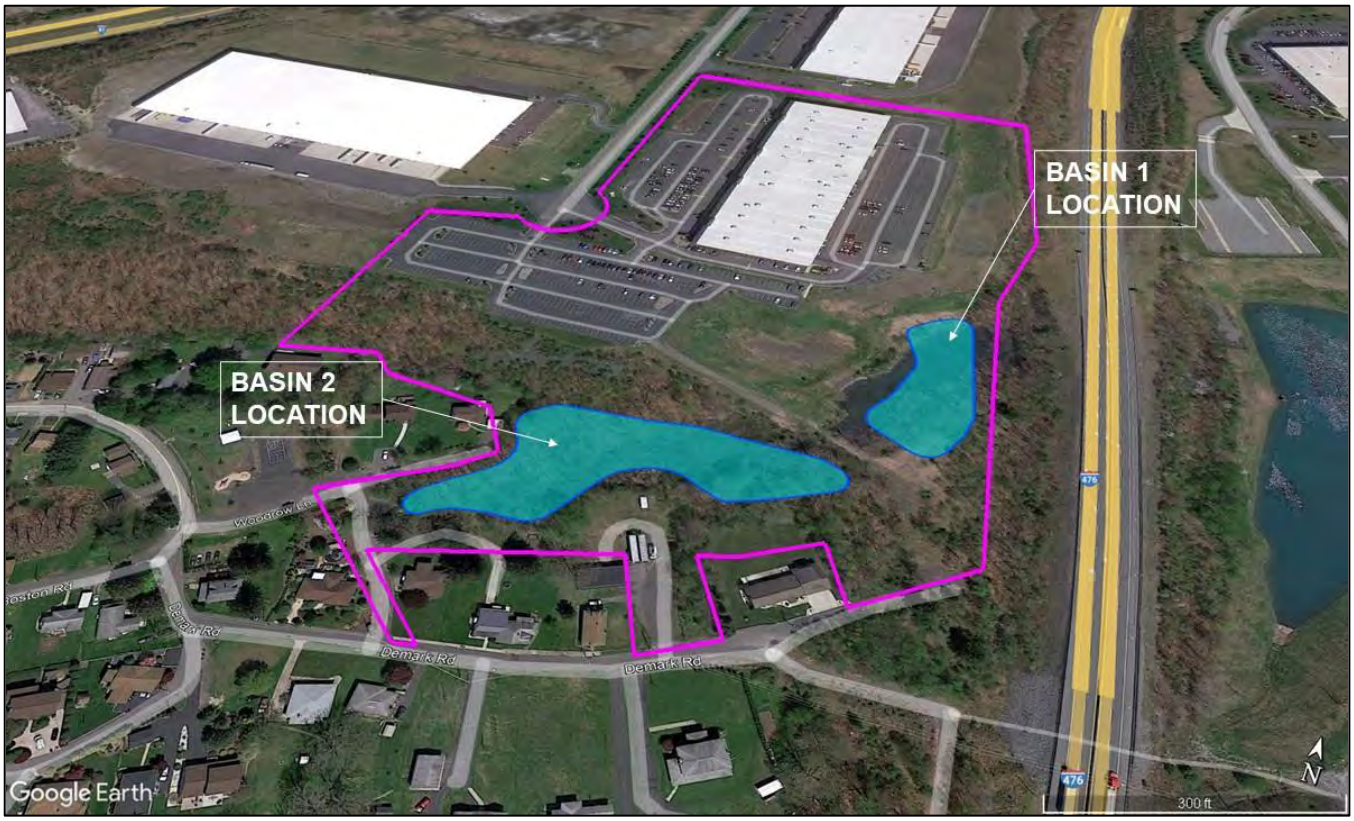
* - equivalent drainage area due to loading

Estimated Pollutant Load Reduction

Total Estimated Load to Basin:	169,684 TSS (lbs/yr)
BMP Efficiency:	76%
Load Reduction for Basins:	128,960 TSS (lbs/yr)

Existing Conditions

- Forested/meadow area location down gradient of commercial areas
- Upstream drainage areas are controlled by 2 infiltration basins and 2 wet ponds.
- Location is downgradient of a business park to maximize pollution removal



Proposed Site Upgrades

- Construction of a new stormwater management basins
  - Manage peak rates (1- through 100-yr storm events)
  - Addition of a forebay and baffles for a low flow channel
  - Addition of organic soils to promote vegetation growth
  - Manage runoff volume through volume retention
- Operations and maintenance (O&M) Plan developed to ensure the continued functionality

Table 1. – Summary of Peak Flow Routings for Basins 1 and 2

BASINS ROUTING			
Return Event (years)	Inflow to Basin 1 (cfs)	Outflow from Basin 2 (cfs)	Max Water Surface Elevation (ft)
2	37.22	28.26	974.20

*BMP Concept Designs have been prepared to provide information on a planning level for each BMP. Final BMP Designs may include revisions to the concept designs.

**Pollutant Loading Rates, and BMP Efficiency figures are from PADEP guidance documents.

***BMP Efficiencies for sediment removal were calculated utilizing Figure 5. Retrofit Removal Adjustor Curve for Sediment, in the Expert Panel Report titled "Recommendations of the Expert Panel to Define Removal Rates for Urban Stormwater Retrofit Projects", dated January 2015.
